

RAPID DEFENDER FROM ROSEHILL SECURITY

A surface mounted vehicle security barrier (VSB), Rapid Defender requires no foundations and can be deployed quickly almost anywhere; from the streets surrounding stadiums to uneven festival sites. It provides both physical protection against vehicle attacks and incursions, and a visual deterrent.

A modular VSB system comprising robust units manufactured from 100% recycled rubber and weighing just 49kg each, Rapid Defender can be installed, moved and de-rigged quickly and easily without the need for special tools or any lifting equipment. A lightweight system, more than 65% lighter than concrete barrier systems, it is easy to transport and a barrier across the width of a road can be installed by four trained technicians in less than fifteen minutes.

Rapid Defender modules are connected together using 20mm diameter steel rods or threaded bar. Pedestrian and/or vehicle portals can also be integrated into the Rapid Defender configuration as required to provide single or multiple access points, without compromising perimeter security.

Rapid Defender's innovative design allows the system to be integrated with other temporary or permanent hostile vehicle mitigation (HVM) or VSB solutions as part of an appropriate and proportionate security strategy. It can also be customised, enabling it to be used for advertising, branding or wayfinding.
